Foreword to the Revised Edition

This document was originally published by the NIMS team as a preview to data acquisition for one orbit. It has has been revised and corrected after data receipt and systematic processing for inclusion on the CD-ROMs containing NIMS Experimental Data Records (EDRs) and Systematic Data Products (Cubes). It is also available on the NIMS website in both PostScript (PS) and Portable Document Format (PDF) form. Some material in the original document has been omitted, and a chapter added describing the data actually returned.

The aim of this guide is to provide detailed information on the various NIMS observations and calibrations. Also included in this document is background information on the orbit. A brief overview of the guide is given below. Please refer to the beginning of each chapter for a detailed list of contents.

Chapter 1 gives a brief introduction to the orbit. Chapter 2 gives an overview and summarizes the NIMS science objectives using tables, spreadsheets and timelines. Chapter 3 contains diagrams of various aspects of spacecraft geometry. Chapter 4 summarizes the NIMS observations in terms of a comprehensive sequence summary and a NIMS Observation Table (Obstab). Chapter 5 is a collection of the Detailed Observation Designs made up of OAPEL forms and POINTER plots. Chapter 6 contains plots of the NIMS wavelength edit tables used. Chapter 7 summarizes the NIMS data return from the orbit.

Introduction

This G8 orbit is the eighth of eleven orbits in Galileo's Tour of the Jovian system. This orbit has a targetted satellite flyby of Ganymede. NIMS will make observations of Jupiter, Io, Europa, Ganymede and Callisto in this orbit. NIMS will also perform some calibrations in this orbit.

There are 12 autonomous reloads of the NIMS RAM code from CDS planned during the G8A encounter period with checksums of the NIMS RAM code before each reload. These reloads are in response to the on-going flight-anomalies where the NIMS RAM code takes some bit hits and halts the instrument during when the spacecraft is close to Jupiter. NIMS NIMS will also return realtime data on a daily basis during the G8A encounter period as a means of monitoring the instrument's status. NIMS personnel will also monitior the NIMS engineering telemetry data on a regular schedule to track the instrument's status.

The G8 orbit is divided into 2 sequence loads: one Encounter Loads (G8A) and one Orbital Cruise Load (G8B). The G8A load begins on D124 of 1997 (05/04/97) and ends on D131 of 1997 (05/11/97) This load contains the flybys of Jupiter, Europa, Io, Ganymede and Callisto. The Cruise Load, G8B, runs from D131 to D173. Playback of the recorded data takes place during the Cruise phase, G8B. A high-level overview timeline of the G8 orbit can be found on the following page.

Chapter 2 - Orbit Overview

Contents

Introduction to Chapter 2

This chapter gives an overview of the NIMS observations in the G8 Orbit.

The text on pages 3 and 4 summarizes the NIMS science objectives for G8. The NIMS calibrations are discussed on page 4. Early data return and G8 playback are also discussed on page 4.

The table on pages 5, 6 and 7 is a time-ordered listing of the NIMS Oapels for G8.

The plot on page 8 shows the geometry of the NIMS G8 observations using a north trajectory pole view projection. The plots on pages 9 and 10 show the geometry of the NIMS Satellite and Jupiter observations. The plot on page 11 shows the geometry of the NIMS G8 calibrations. The plot on page 12 shows the geometry of the NIMS RAM Reloads and MROs.

The spreadsheet on pages 13 through 15 summarizes the various inputs for the NIMS G8 Observations. The spreadsheet on pages 16 through 21 summarizes the resource usage for the NIMS G8 observations. The spreadsheet on pages 22 through 27 summarize the Playback Model for the NIMS G8 observations.

The table on pages 28 through 31 lists various NIMS G8 observing parameters: target latitude/longitude, range, cone angle, incidence angle (light), emission angle (view) and phase angle.

The tapemap on pages 32 through 37 shows the placement of the G8 observations on the spacecraft's tape recorder. The NIMS observation names are written with a larger type.

The timeline on pages 38 through 43 shows the preliminary G8 playback schedule.

The NIMS G8 mosaic designs are summarized on pages 44 through 51 in time-order.

NIMS G8 SCIENCE OVERVIEW

Ganymede Science

A total of six observations are planned for Ganymede. The first observation of Osiris (OSIRIS), a central dome crater, will be a study of the composition and nature of large central dome crater evolution. The next observation (URUK__) is of the Uruk Sulcus region and studies its subsurface geology and mineralogy. Three observations are planned to study variations in chemical composition in the amount of dark and light material in the leading and trailing hemisphere (TRANSI, LIDARK and DARTRL). In the trailing hemisphere (DRKTRL), NIMS will study the mineralogy of a dark albedo unit that might have been modified by magnetospheric bombardment. The last observation (MELKAR) is of Melkart crater to study its composition and morphology. This is a joint observation with SSI.

Io Science

NIMS Io monitoring contain CHEMIS and THRMAL observations which look at the dayside and nightside to map surface composition and to search for hotspots on the surface. Also, there are five VOLCAN observations which will monitor chosen regions Loki, Pelee, Kanehekili.

Europa Science

G8 is a non-targeted encounter for Europa in which NIMS has two observations planned. These observations will aim to identify and characterize temperature variability as well as determining green house solid state on Europa.

Callisto Science

NIMS has planned two Callisto global composition maps for G8. Geometry provides a unique south polar pass in which NIMS will map 60% of lit surface that will not be obtained for the remainder of the tour. Lastly, there are two planned crater observations for the Buri and Adlinda craters which will determine compositional differences, structure and minor constituents.

NIMS G8 SCIENCE OVERVIEW

Jupiter Science

The NIMS atmospheric observations for G8 constitute feature track campaigns centered on the South Polar Boundary feature. There are a total of sixteen feature track observations for this region. The phase angles for this feature campaign are 10, 41, 71, 104, 122, 133 and 146 degrees. Furthermore, NIMS has planned partial feature track campaigns at 10 degrees phase angle near 50 degrees south temperate latitude. For the feature track and partial feature track campaigns, Jupiter will be imaged in 68 colors, with 25 colors being transmitted.

Moreover, NIMS will be doing a ride along with UVS and MWG to observe H3+ emission of Jupiter aurora. Also, observations are planned to do high spectral resolution mapping of the South Polar Boundary to acquire several CH4 and H2 absorption features.

In addition to the high spectral observations, NIMS will also obtain 5 and 3 micron night-time maps of trace species within the South Polar campaign feature. The phase angle for these high spectral observations is 71 degrees. Also planned is a high spectral and spatial resolution nightside map of a hotspot region to assess water abundance utilizing three micron spectroscopy.

Lastly, NIMS has planned several Jupiter thermal north/south stripe observations which will assess lower-troposphere properties such as phosphine abundance variation and 5 micrometer variability of ammonia cloud opacity.

Calibration

There are nine NIMS calibration observations in G8: five darkcals, one PCT cal, two RCT cals and 1 OPCAL. The darkcal observations (HNDARK) measure dark levels in three gain states. The PCT cal (PCTRLT) calibrates NIMS in the visible bands. THe RCT cals (RCTRLT) calibrate NIMS in the thermal bands. THE OPCAL calibrates the NIMS grating.

Early Data Return

There are 15 realtime NIMS observations in G8: 3 instrument health checks of 3 wavelengths (HEALTH), 3 408 wavelength Jupiter Hotspot Observations (RTHOTS), 1 408 and 2 51 wavelength Europa observations (WARMCV, COOLCV and EURORT), 1 PCT calibration, 2 RCT calibrations, one OPCAL calibration and 2 Detector 3 checks (DET3AN).

G8 Playback

G8 playback is split into two passes through the tape.

Chapter 3 - Orbit Geometries

Contents

Introduction to Chapter 3

This chapter contains diagrams of various aspects of geometry for the G8 Orbit.

The figure on page 3 is a North Trajectory Pole View of the G8 Orbit from apoapsis to apoapsis.

The figure on page 4 is a North Trajectory Pole View of the G8 Orbit from +/- 5 days of Ganymede closest approach.

The figure on page 5 is a North Trajectory Pole View of the G8 Orbit from +/- 1 day of Ganymede closest approach.

The figure on page 6 shows the spacecraft's groundtrack on Ganymede at Ganymede closest approach.

The figure on page 7 shows the spacecraft's groundtrack on Jupiter at Jupiter closest approach.

The figure on page 8 is a South Trajectory Pole View of the G8 Orbit from +/- 1 hour of Ganymede closest approach.

The figure on page 9 shows spacecraft altitude with respect to Ganymede (km).

The figure on page 10 shows the cone angle of Ganymede (Earth - S/C - Ganymede deg).

The figure on page 11 shows the Sun-Ganymede-S/C Angle (deg).

The figure on page 12 shows spacecraft range to Jupiter's center of mass (Rj).

The figure on page 13 shows the cone angle of Jupiter (Earth - S/C - Jupiter, deg).

The figure on page 14 shows the Sun-Jupiter-S/C Angle (deg).

Chapter 4 - NIMS Observation Summaries

Contents

Introduction to Chapter 4

This chapter summarizes the NIMS G8 observations in terms of a comprehensive sequence summary, Individual Obstab Summaries and a NIMS Obstab (Observation Table).

The NIMS Sequence Summary is a time-ordered listing of all spacecraft activity pertinent to NIMS operations for the G8 Sequence. The information in this summary is derived from the G8 SEFs (Spacecraft Event File) and PBTs (Playback Tables) with inputs from the NIMS Science Coordinators regarding the start time and duration of the NIMS observations. There are twelve columns of information in this table:

1) Line - Line Count.
2) YR - Year.
3) DOY - Day of Year.
4) Time - SCET Time (UTC).
5) PSID - Parameter Set ID of the SEF line.
6) Command - Command name from the SEF.
7) Parameters - Parameters from the above Command Line.
8) Description - Description of the above Command for NIMS.
9) GCM - NIMS Gain, Chopper mode, Instrument Mode.
   Gain = 1,2,3 or 4.
   Chopper Mode = R (Reference) or 6 (63Hz).
   Instrement Mode = 0-15
10) GO - NIMS Grating Offset.
11) GS - NIMS Grating Start Position.
12) RIM,MF,I - SCLK of the Command Line (RIM:MF:RTI)

An additional line is inserted into this table at the start and stop times of each NIMS Observation (Oapel) to bracket the commands which affect each NIMS Observation. The NIMS Playback Select and DeSelect times are also inserted into this table to correlate the playback requests with the observations.

The Individual Obstab Summaries are expansions of the NIMS Obstab to one page per Obstab entry for ease in reading the NIMS Obstab.

The NIMS Obstab (Observation Table) is a time-ordered listing of the NIMS obsrvation parameters for use by downlink data processing of the NIMS G8 data. It is also derived from the G8 SEFs and PBTs. Each Obstab entry is 512 bytes long but is presented here as 4 lines of 128 characters per entry.

NIMS G8 OBSTAB

This is a time-ordered ASCII TABLE (listing) of GALILEO NIMS observation parameters for use by downlink data processing of the NIMS G8 data. Each Obstab entry is 512 bytes long but is presented here as 4 lines of 128 characters per entry. Included items come from NIMS commands in (1) the Standard Sequence Data File (SSDF) and (2) the Playback Table Update Process (PTUP), plus some items from (3) the NIMS/CDS software load.

Note that SCLK1, SCLK2, SCET1 and SCET2 of non-realtime observations reflect the amount of data actually played back, rather than the amount recorded on tape. Likewise, the wavelength edit table pointers of non-realtime observations point to the playback edit table masks, rather than the ones used during recording.

Some of these items are needed for MIPS realtime processing of NIMS data, others for NIMSMERGE generation of the EDR and still others by NIMS/ISIS and MIPS systematic processing of EDRs into cubes. Missing non-required items will not interfere with a processing step. For completeness, almost all uplinked parameters are included in the table. (Only those items which will almost certainly remain constant have been omitted; e.g. Rice decision tables.)

The source below is one of:
- SEF for the Standard Sequence Data File (SSDF), specifying parameters of one of the NIMS (37) commands
- PBK for the Playback Table Update Process (PTUP), specifying parameters of the NIMPBK SINGLE command
- S/W for the NIMS/CDS software load process
- NIMS for NIMS team systematic processing requests to MIPS

* indicates item absolutely required for UDR generation (decompression, wavelength edit processing)
\# indicates item useful for UDR generation (for checking)
unmarked items needed for cube generation or useful for general information
<tbd> indicates more details will be forthcoming

Chapter 5 - Detailed Observation Designs

Introduction to Chapter 5

Detailed Observation Designs

Each NIMS Detailed Observation Design consists of an OAPEL form and a Pointer plot. The OAPEL form is a brief description of the design of the observation. The Pointer plot is a plot of the target body with the NIMS footprint incorporated in the mosaic design superimposed on the target body. The size and orientation of the target body is plotted as it appears at the time of the first NIMS footprint plotted. For long observations, the target body may rotate or move relative to the spacecraft during the observation. Some observations, such as calibrations, do not have Pointer plots.

The Pointer plots and OAPEL forms in this chapter have been updated to report the actual data returned.

The Pointer plots have the spatial extent of the actual data returned outlined with a thick line. When no data were returned for a particular observation, its Pointer plot has a single slash across the plot with the text "NO DATA RETURNED" printed in the upper left corner of the plot.

The text of the OAPEL forms have been modified to reflect the actual NIMS instrument parameters for playback. An extra line containing one or some of the following statements has been added to the Observation Objective section of the OAPEL form to report the data retun status:

"Data Returned" == Data from this observation returned
"No Data Returned" == NO Data from this observation returned
"Processor Halted" == The NIMS Processor had halted at this time.

More information regarding NIMS data return can be found in Chapter 7 of this guide.

Ride-Along with SSI. Alias: G8CSVGRGAP01

Fill gap in Voyager medium-resolution coverage in the leading southern hemisphere, a region between about 60 and 100 degrees longitude and between 20 and 60 degrees south latitude. Cover some of area recorded on C3 orbit but de-selected from playback due to downlink MBTG constraints. Complete global survey of large ring structures, which are concentrated in the leading hemisphere.

This is the first of three observations obtained on a rotation with phase angle approximately 41 degrees. Jupiter imaged in 4 colors, using NIMS downlink wavelength table JFT04A. This observation acquired with South Polar Boundary feature near the terminator, assuming feature coordinates 68 degrees south latitude (planetographic) and 140 degrees west longitude (System III).

Observation Objective

One of 16 OAPELs constituting the feature tracks for the South Polar Boundary feature campaign. This is the second of three observations obtained on a rotation with phase angle approximately 41 degrees. Jupiter imaged in 4 colors, using NIMS downlink wavelength table JFT04A. This observation acquired with South Polar Boundary feature near minimum airmass, assuming feature coordinates 68 degrees south latitude (planetographic) and 140 degrees west longitude (System III).

Observation Objective

This long distant encounter of Europa Covers unique west longitude (0-90 degrees) of the Trailing Hemisphere not available in any other orbits of the GLL main tour. This is a cooperative observation with PPR.

Update: PPR will not be on this observation. The duration of this observation was shortened from 29 minutes to 1 minute, to save on tape, and 5 minutes in real-time to determine a warming curve for Europa. The total duration of this observation is 6

This observation was incorrectly mirror blocked and Europa was not observed.

Observation Objective

One of 16 OAPELs constituting the feature tracks for the South Polar Boundary feature campaign. This is the third of three observations obtained on a rotation with phase angle approximately 10 degrees (the other two observations are combined with partial feature track A observations in FEAP1001 and FEAP1002). Jupiter imaged in 19 colors, using NIMS downlink wavelength table JFT19A. This observation acquired with South Polar Boundary feature toward the limb, assuming feature coordinates 68 degrees south latitude (planetographic) and 140 degrees west longitude (System III).

Data Returned

Design Detail

Short map, Nyquist-sampled observation of 1 X 1 (10 X 10 mrad) area centered on South Polar Boundary feature near 140 degrees west longitude, 68 degrees south planetographic latitude. Observation Objective

High spectral resolution 5-micron and 3-micron night-time maps of trace species within the South Polar campaign feature. The first scan is a 5-micron map, of complete spectral and spatial sampling over the 4.28 to 5.22 micron interval. The campaign feature, centered at 140 degrees west longitude (System III), 68 degrees south planetographic latitude, is observed near 25 degrees relative longitude during the phase angle approximately 71 degrees rotation. The feature is first scanned in the 80 wavelengths specified by NIMS wavelength table J5M80B. The second scan is a 3-micron map using 80 wavelengths specified by wavelength table J3M80B, spanning the wavelength range 2.50 - 3.44 microns.

Observation Objective

Jupiter North/South, pole to pole night-time stripe for pole to pole assessment of lower-troposphere properties such as phosphine abundance variation and 5-um variability of ammonia cloud opacity. Night time observation 20 degrees relative longitude from the central meridian at 75 degree phase angle near 11 Rj, using NIMS wavelength table J5M80B spanning 4.279 - 5.220 microns. Equatorial longitude approximately 170 degrees west. To save tape, recording delayed 1146 seconds from the start of scanning. Recorded latitude are then 5 degrees north to the south polar region (approximately 75 degrees south).

Data Returned

Design Detail

Long map, Nyquist sampled observation of pole-to-pole stripe.
About 19 tiers, each tier acquiring 13 spectra, spanning 3.25 mradians in the east-west direction covering 2.0 degrees of Jovian longitude, at 395 KM IFOV spatial resolution. Each tier lasts 130.0 seconds including 17.333 sec for repositioning to the next tier. Total observations time is 18*130 + 13*8.6667 = 2452.666 sec = 00:40:52.666 (more accruate Pointer designs indicate) 2418.00 seconds. To save 0.0385 tracks of tape, only the last 2418 - 1146 = 1272 seconds recorded. This results in recording 0.042735 tracks to return 1.281 MBTG.
Record begins at JEE+CDS 655 end record at JEE+CDS 676.
One rim reserved for targetting.

Night time observation 17 degrees relative longitude from the central meridian at 78 degree phase angle near 11 Rj, using NIMS wavelength table J5M80B spanning 4.279 - 5.220 microns.
Equatorial longitude approximately 210 degrees west.

Data Returned

Design Detail

Long map, Nyquist sampled observation of pole-to-pole stripe.
About 19 tiers, each tier acquiring 19 spectra, spanning 4.75 mradians in the east-west direction covering 3.0 degrees of Jovian longitude, at 395 KM IFOV spatial resolution. Each tier lasts 182 seconds including 17.333 sec for repositiong to the next tier. Total observation time is 18*182 + 19*8.6667 = 3440.667 sec = 00:57:20.67 resulting in recording 0.11559 tracks to return 3.4648 MBTG.
Two rims reserved for targetting.

Data Returned

Design Detail

Long map, Nyquist-sampled observation of approximately 3.3 X 1 area (133 X 20 NIMSels sampled) in hotspot region centered at approximately twelve degrees relative longitude away from the central meridian on Jupiter's nightside, at about 9 degrees north latitude. The area mapped intersects 5 micron THRMNS04 OAPEL area, to achieve spectral coverage at both 3 and 5 microns of this particularly hot region. Map accquired at approximately 395/KM resolution, covering 3.325 mradians in the East/West direction and 21 degrees of longitude. Total observaion time is 133*8.666 = 1152.667 sec or 19 RIMS resulting in 0.03872 tracks recorded to return 0.6288 MBTG. Two RIMS reserved for targetting.

Observation Objective

Required to verify instrument operation.
These observations provide a 3 detector view of the instrument.
The detectors are selected such that a bright and a dark channel
will exist for either a satellite or Jupiter for a target.
The observations are spaced approximately 24 hours apart.

Observation Objective

One of 16 OAPELs constituting the feature tracks for the South Polar Boundary feature campaign. Also, the last of six OAPELS for Partial Feature Campaign A and the last of seven OAPELS for Partial Feature Campaign B. For the primary feature campaign, this is the first of two observations obtained on a rotation with phase angle approximately 146 degrees. For Partial Feature Campaigns A and B, this is the only observation obtained on this rotation. Jupiter imaged in 19 colors, using NIMS downlink wavelength table JFT19A. This observation acquired with South Polar Boundary feature near minimum airmass, assuming feature coordinates 68 degrees south latitude (planetographic) and 140 degrees west longitude (System III).

Data Returned

Design Detail

Short map, Nyquist-sampled observation of 1 x 3 (10 East/West x 26 North/South mrad) covering the campaign feature plus both Partial Features. Longitudinal axis of the area covered centered at 140 degrees west longitude, with southernmost tier centered at 140 degrees west longitude, 68 degrees south planetographic latitude. There is a twenty percent overlap between tiers. Spacecraft distance about 2.19 million KM, NIMS IFOV (NIMSEL) = 1095 KM; 1 x 3 mosaic covers 21900 KM East/West x 56940 KM North/South. About 340 seconds of scanning/recording, including 40 seconds total for reposition slews, accumulating 0.30542 MBTG in 19 colors, and using 0.01142 tracks. Four rims reserved for targetting.

Observation Objective

Real Time Test of Detector 3 Failure

Power NIMS Off then On to see if Detector 3 can be recovered.

Previous tests have not allowed for the instrument to be powered off for longer than 5 minutes. This test has the instrument off for 1 hour - adequate time to allow for capcitor discharge and latches to 'unstick' per R. Steinkraus.

This is the last test planned to 'rescue' detector 3.

Introduction to Chapter 6

NIMS Edit Table Plots

This chapter contains plots of the NIMS Edit Tables used in G8. The representative spectra used in these plots are observational reference spectra for the target body as obtained from telescopic observations from the Earth. Each reference spectrum is a composite of multiple published sources. Vertical lines below the reference curves mark the wavelengths selected for return. Where no spectral information is available, the selected wavelengths are shown as lines with amplitude equal to .05 on the vertical axis.

Chapter 7 - Data Return

Contents

Introduction to Chapter 7

This chapter is a report on the NIMS data return for the G8 orbit. Due to the low downlink data rates available for Galileo Jupiter Operations and other unforeseen and unpredictable events during the G8 Encounter and Cruise, not all NIMS data recorded on the tape recorder or selected in real-time were returned. The previous 6 chapters nominally describe the planning and intention of the NIMS observations for this orbit, except the obstab section in chapter 4 which was updated to give the latest parameters for the data that were actually returned.

Twelve NIMS software reloads were inserted into the G8 Encounter sequence to protect against processor halts. During G8 no NIMS observations were lost due to processor halts. The approach that we are taking to avoid data loss due to processor halts has proven to be very successful.

Detectors 3 and 8 are still not functioning and are expected to be lost for the rest of the mission. One final attempt to revive these failed detectors was unsuccessful in reviving them.

The plots on the pages 3 and 4 show the geometry of the NIMS G8 observations using a north trajectory pole projection. The 'returned' observations are in Bold characters and the 'non-returned' in gray.

The spreadsheets on pages 5 through 10 summarize the 'final' playback model for the 'returned' data.

The text on page 11 gives a 'recap' of the G8 playback events which affected which observations were returned.

A Timeline of G8 playback events is on pages 12 through 14.

The text on page 15 describes the G8 NIMS Anomalies.

The text on page 16 gives a brief discussion of the NIMS data files. Additional information about NIMS data formats, data types, data labels and data access is given on pages 17 and 18.

The text on page 19 is a guide to understanding the NIMS MASK.

RECAP OF G8 PLAYBACK EVENTS

NIMS' downlink bits allocation for G8 was about 50% larger than the total bits received for any prior orbit. As a result nearly all of the NIMS data recorded during the encounter was returned to Earth.

G8 was one of only 3 orbits during the Galileo prime mission in which no radiation-induced stoppages of the instrument software were detected or suspected (the others were E4 and E11).

Two distant observations of Europa were undertaken during the encounter period (G8ENCLIPSE_01, G8ENTRAIL__01). To conserve bits, mirror blocking was specified (this records a subset of the standard 20 pixels). An error in the commands led to recording of only dark sky, and as a result these observations were not played back.

The playback process, although made complex by the number of observations and the details of efficiently returning them, went smoothly until 12 June, when the tape recorder went into limited search mode. This continued until commands to terminate the process were received from the ground. This event cost about 6.5 Megabits, and resulted in a down-to-the wire photo-finish in the race to get all the data down.

G8 Playback Events Timeline (04-04-97 to 06-22-97)

04-04-97: NIMS' downlink allocation is 56 Mbits. The observations G7ENCLIPSE01 and G7ENTRAIL_01 are added to the sequence. Wavelength tables called out for many observations still include detector 3 wavelengths. Jupiter feature track observations and Io VOLCAN observations return subsets of the total recorded wavelengths.

04-16-97: NIMS receives an additional 2 Mbits since UVS and PPR have more allocation than they can use. Six Jupiter observation wavelength tables go from 25 bands selected to 68 (the maximum recorded).

04-24-97: New telemetry modeling with 0.3 dB margin increases NIMS' downlink allocation by 10 Mbits. All satellite observations are upped to full spatial coverage and full wavelength coverage. The same goes for Jupiter with one exception, G7JNUM3MAP01, where we will get 40 of 253 wavelengths recorded.

04-30-97: Playback table update. Callisto and Io wavelength tables modified to remove detector 3 wavelengths.

05-04-97: G8 Encounter begins.

05-05-97: Playback table update. Ganymede wavelength tables updated to remove detector 3 wavelengths.

05-06-97: NIMS G8 recording begins with G8CNGLOBAL01.

05-07-97: Playback table update. A technical problem with NIMS wavelength tables. CDS memory has 75 slots for wavelength editing byte groups for any given segment of the playback table. Segments consist of groups of observations in time order; a maximum of 4 segments is held in CDS memory at any given time. To return 216 wavelengths for one observation, 25 byte groups must be uplinked. This means a particular segment can have only 3 NIMS observations. This can make segments very short, with the negative consequence that CDS may whip through all the stored commands before new segments can be uplinked, resulting in CDS' pausing playback and production of fill bits instead of data in the downlink data stream. The solution at this point was to reinstate tables commanding 228 wavelengths for 5 small Io THRMAL and VOLCAN observations. This table requires fewer edit groups but returns some detector 3 wavelengths. Ganymede close approach occurs at 15:57 GMT.

05-08-97: Perijove is reached at 11:42 GMT.

05-11-97: Playback begins.

05-21-97: Playback table update. The following is an excerpt from the memo describing the update for that date.

Dozens of minor modifications of the playback table were made in this update in order to make best use of our allocation and for efficiency reasons. In the latter category are wavelength table changes for CHEMIS03 and VOLCAN02, requested by the coordinators. Returning 228 wavelengths (including det 3) instead of 216 resolves segmentation problems and avoids potentially pausing playback. NIMS observations of satellites with appreciable amounts of dark sky are usually thresholded to improve compression. In this orbit, from G8GNOSIRIS01 forward, thresholding will NOT be used for any observations, with one exception (CNGLOBAL02). We need to receive additional downlink bits in order to bring the pass 2 portion of this down without thresholding. NIMS data obtained during 3 SSI observations of Callisto will now be returned in pass 2 (CNVGRGAP01+, CNSPOLAR01+, CNADLNDA01+). The first of these was recorded with the DARK34 table; the others with standard Callisto FM102 and LM244 tables. For the AWG side: Following Kevin's instructions we are using a table returning 100 wavelengths (up from 40) for the JNUM3MAP01 observation. To accomplish this we cut back on wavelengths returned (from 68 to 43) for 5 observations (JNFEA04101 and 04103, JNPFTB1001, JNFEAP1002, and JNPFTB7101). The six observations listed above are the only AWG cases where we are not bringing down all recorded wavelengths. Playback of the two Europa observations was deleted from the plan since only dark sky was recorded due to incorrect specification of mirror blocking.

05-28-97: Tape slewing inefficiency has been smaller than predicted. NIMS receives another 0.5 Mb of allocation. This is used to restore G7JNFEA04103 and G7JNFEAP1002 to maximum wavelength coverage (68).

06-03-97: NIMS receives another 1.75 Mbits from office margin.

06-11-97: Playback table update. Five sets of gap-filling playback commands are added to pick up data that was not received in pass 1. The remainder of the office margin is released and NIMS gets 2.5 Mbits. Four new sets of commands were entered to recover the wavelengths that were left behind in pass 1 playback of G7JNFEA04101, G7JNPFTB1001, G7JNPFTB7001, and G7JNUM3MAP01.

06-12-97: The tape recorder pauses playback on top of a boundary between two recorded observations. Some data is present but the time tag is incorrect. When playback resumes the tape recorder goes into limited search, trying to find the bad date it has picked up. It continues this search until commands from the ground terminate playback, at a cost of some 6.5 Mbits of downlink.

06-13-97: Cuts must be made due to the loss of allocation due to the limited search event. NIMS cuts out the additional wavelengths playback of G7JNUM3MAP01.

06-19-97: Playback is running about 7 hours behind schedule due to undercompression by SSI, amounting to about 1.4 Mbits.

06-22-97: Playback terminates. Our last observation arrives intact, with perhaps a few bits trimmed from the end. We are not successful in returning G7HNDARK04 and 05; gaps in data capture by the DSN claimed them in passes 1 and 2.

NIMS Anomaly Report - G8 Sequence

There were no NIMS anomalies during G8. No processor Halts were detected.

Detectors 3 and 8 are still not functioning and are expected to be lost for the rest of the mission.

Detectors 3 and 8

One last attempt was made to revive detectors 3 and 8 during G8 cruise. Previous tests of detectors 3 and 8 had not powered off the NIMS instrument for longer than 5 minutes. The G8 cruise test (G8NNDET3AN) had the NIMS instrument powered off for 1 hour - adequate time to allow for capacitor discharge and latches to unstick. This was the last planed attempt to revive these two detectors.

The test ran successfully, but detectors 3 and 8 were not revived.

Summary:

1. No NIMS processor Halts were detected during the G8 Encounter.

2. The 12 NIMS software reloads from CDS most likely prevented the potentially disastrous effects of the NIMS processor Halts and protected the NIMS observations during the Encounter.

3. Frequent NIMS realtime observations, both science observations and instrument health monitoring observations, verified that NIMS was functioning normally at various time points throughout the encounter.

4. The error avoidance measures applied to the G8 Encounter as determined in the analysis of the processor halts that occurred in earlier orbits were shown to be the proper response for dealing with the inevitable occurence of radiation-induced NIMS processor halts.

NIMS Archived EDRs and CUBEs

The NIMS data are stored in EDRs (Experimental Data Records) produced by JPL-MIPS (Multi-mission Image Processing System). The NIMS Phase2 EDR is described in the NIMS EDR SIS (Software Interface Specification) Number 232-08. The same information is available in both human and machine-readable form in the PDS (Planetary Data System) structure files EDRHDR.FMT and EDRDATA.FMT in the LABEL directory of the NIMS EDR CD-ROM. Each observation has at least one EDR. The EDR file name is derived from the 12 character observation name plus a single character which allows an observation to be broken up into multiple EDRs. The EDRs have a Vicar label, followed by a PDS/ISIS label, binary header records and the data records. For archiving on CD-ROM, the Vicar labels are detached from the EDR (but kept separately on CD) and the file is renamed so as to conform to the 8.3 DOS file-naming convention. The 8.3 EDR name consists of a 2 character orbit identifier, a single character target identifier, a 3 digit counter and the suffix EDR. For example, the MIPS EDR G1GNGLOBAL01A.1 becomes G1G001.EDR. More information about NIMS EDRs can be found in the VOLINFO.TXT file on the EDR CD-ROM.

NIMS EDR data typically require considerable processing before they are readily amenable to science analysis. Normally, the EDRs are processed into spectral image cubes by one of several sets of software. MIPS systematically processes the EDRs into CUBEs (band sequential image files) and MASKs (spatial/spectral summary images) which are distributed on the NIMS CUBE CD-ROMs. Information about the structure of the NIMS CUBEs can be found in the VOLINFO.TXT file on the CUBE CD-ROM. The name of the CUBE file is derived from the input EDR filename. For archiving on CD-ROM, the CUBE files are renamed so as to conform to the 8.3 DOS file-naming convention. The 8.3 CUBE name consists of a 2 character orbit identifier, a single character target identifier, a 3 digit counter, a single character cube-type identifier, a single character data unit-type (DN, radiance or IOF) and the suffix QUB. For example, the MIPS IOF radiance cube for the observation G1GNGLOBAL01A.1 (G1G001) becomes G1G001CR.EDR. The summary MASKs on the CD-ROM have the same 6 character name as the EDR name with the suffix JPG or GIF to denote its graphics format.

NIMS Data Format - Data types - Data Labels - Data Access

Data Format

All data files have PDS labels. The raw data (EDR) file contains time-sequential, 16 bit integers. Reduced data files (TUBES and CUBES) may be viewed as images or spectra. They contain VAX real numbers, are band sequential (BSQ - the images are stacked in band order) and have geometry information appended as backplanes after the last NIMS band.

Data Types

Mask files contain summary images (3 band BSQ) and spectra of up to six selected regions that provide a quick indication of data location, data quality and spectral content. A Guide to understanding the NIMS mask is available.

Cube files contain data that have been projected and resampled. The core data are BSQ - spatial in the first two dimensions, and spectral in the third. Cubes of the satellites are projected in point-of-view, and, with few exceptions have no photometric correction applied. Cubes of Jupiter are (generally) projected as simple cylindrical. Cubes of Europa, Ganymede, and Callisto have been despiked. The cubes are available both in radiance and I/F (intensity divided by flux) form.

Tube files contain data in (almost) time order and normally have a NIMS-related 20 pixel spatial dimension (20 x n or n x 20). Projection coordinates are contained in backplanes, but the data have not been resampled. The data are in units of radiance and no despiking has been applied. All data in cubes are also available in tube form. Some data (such as spatially undersampled data) appear in tube form only.

A spike file contains a list of pixels that have been identified as spikes, but not replaced, in the tube. Spike files can be used to remove spikes from both tube and EDR files.

EDR files contain the most primitive form of the data available. They should be used only for advanced data analysis. The format is complex and the files do not form images or spectra without prior processing.

Data Labels

A data label (PDS form) is attached to the front of each file (except masks, which have an attached VICAR label and a detached PDS label). The labels are in ASCII keyword=value format and contain pointers to various data objects in the file, descriptions of the data objects and descriptions of the observation associated with the file. A history object in similar format follows and describes the processing steps that produced the file. Much of this information is necessary for understanding and viewing the cube. In particular, the label contains the offset to the cube, the dimensions of the cube, axes labels, and explicit wavelength information.

Data Access

Software for processing this data is called ISIS and is available for DEC VAX VMS, SUN Solaris, DEC Alpha Digital Unix, Silicon Graphics Unix and PC LINUX systems. The Unix versions are available from the USGS Astrogeology team. Images from NIMS cubes and tubes can be viewed with any image display program which allows an offset from the beginning of the file to the selected image. Packages tested include ISIS, VICAR, ENVI, SAO IMAGE, and NASAVIEW. ISIS and ENVI (and soon NASAVIEW) additionally display spectra. The ISIS viewer is named CV (UNIX) or QL3 (VMS).

Labels may be displayed with some editors (eg DOS edit), and with most "type" and "search" functions. Some editors do not recognize the PDS line termination conventions. The label may be listed by the ISIS function LHLIST (VMS) or LABEL (UNIX).

Software for converting EDRs to cubes exist in both ISIS (DEC VAX VMS) and VICAR (DEC Alpha VMS) versions only. A primitive list of values in an EDR may be obtained with the program EDRDMP2.

Understanding the NIMS Mask

The NIMS mask is designed to provide a quick summary of the contents of a NIMS data cube (or tube). It displays a view of both the spatial and spectral content of the data.

The mask has four regions. Starting from the upper left and proceeding clockwise: a spatial display; six or fewer representative spectra; annotation; and a spectral histogram.

The spatial display of an observation which has been projected and resampled (a cube) has a maximum size of 600x600 pixels. This is overlaid with surface coordinates and is embedded in a 700x700 grid of pixel coordinates. It is accompanied by two 1-dimensional histograms describing the raw image and the image stretched for display. The data image can range from a simple combination of up to 3 NIMS bands displayed in the RGB planes, to complicated arithmetic functions of NIMS bands displayed in the RGB planes. (The formulas appear as annotation below the histograms.) The graphics directly below the image show the input and output data histograms for the three color planes. The "shortest" color for each bin displays in front. The image also contains from one to six numbered rectangles, which show the from which averaged spectra (displayed on the right) were taken.

The spatial display of an observation in time sequence (a tube) is a graphic showing a footprint of the observation over a grid of surface coordinates on the target body. Numerals 1-6 on the graphic mark the locations of the average spectra displayed on the right.

The spectra to the right of the image may display either BDRF or radiance (or both). If both are displayed, then a vertical "radiance fence" line will appear where the breakpoint occurs. This permits display of both atmospheric data, which have significant reflectance and thermal components, and I/F satellite surface data which have strong absorptions at longer wavelengths (such as water spectra.) The spectra are labelled with wavelength in microns and location in both pixel and latitude-longitude space.

The annotation provides information about the observation, including its name, a brief description, its geometry, instrument and projection parameters. TCA is the time from Galileo’s closest approach to the target body.

The 2-dimensional spectral histogram in the lower left corner shows the number of pixels at a given radiance for each wavelength. If a surface contains spatial mixtures with significantly different spatial fractions for several components, the spectra of the components will be evident in this display.
